INTRODUCTION

Recovering the lost art of agriculture, biodynamics

"We see everywhere the spread of a change in awareness concerning the horribly destructive effects of chemical products that have been used in agriculture over the past few decades. But how can we definitively get out of this impasse that has been, alas, so neatly built up with the complicity, perhaps unconsciously, of so many chambers of agriculture?

This is the question being asked today that is pressing ever more urgently: how can we get out of this nasty business?

The responses to this question remain confused and often unsatisfactory on an ethical level. There is an effort to try and find less harmful products, more "ecological" equipment or to reproduce molecules from natural products, etc. But the fundamental responses are not to be found there; access to sustainable, human solutions, even if they shock the teaching or scientific professions must be found by thinking differently.

What does this mean?

To strengthen the expression of the living, of life, and thereby limit or prevent sickness, we must have an entirely different grasp of the world of the living than we do today. We cannot fully understand life by dissecting a living organism until we arrive at the infinitely small and in addition, by studying it on a strictly material level. Matter, which scientists adulate so much because of the incomplete training they have received, is but a result, or the outcome of processes that have fixed different substances is a precise form to end up as a vegetable species or something else.

What should interest us for a profound understanding of the plant are the processes that created it, not the plant itself. If we take the example of a pastry chef who has made a cake, what interests us is the chef more than the cake itself, even if it's analysed from every angle. This is the same with matter.

These forces that we call “life”, and it must be understood absolutely to achieve real progress, is extinguished, and finally dies in the matter. Death is only a triumph of materiality over the living. To understand life profoundly, we must leave matter behind and focus on understanding the system that gives life to the Earth.

The Earth, our lovely planet does not possess life, it receives it by belonging to a solar and stellar system. Without them, the Earth would die. In other words, if we took the Earth out of the solar system or were to cover it with an immense opaque plastic (which in a sense we are beginning to do, especially on an energetic level by this saturation of Hertzian pollution we’re imposing on the atmosphere without having the slightest clue about what we are doing in order to use cell phones, GPS, satellites, etc.), life would disappear almost entirely.

Let us now ask ourselves the following question: How does life arrive on Earth? And at the same time, many other complementary questions:

How does the solar system remain constant? Why do the planets have such stable orbits, each one with such different time frames (84 days for Mercury and nearly 30 years for Saturn)? What affinities are expressed through these rhythms?

Why is our solar system moving at a rate of 30kms a second towards Sirius? What are the active forces that maintain these balances and what is their meaning? There are dozens, hundreds of questions like these that should be asked by agricultural students so that they become aware intheir future decisions of the impact of their gestures.

Initially one must only understand that behind these subtle, magnificent balances, there is first a balance of power that we could simplify by terms such as “solar attraction” and “gravity”. Each one “pulls” in its own direction and the whole forms a celestial balance though which, indirectly, we live.

The key words are “balances of power”. What are they? How do they function? Can we make use of them? (see Schauberger and the forces of implosion for example). Those are the key questions that could help our agricultural interventions to evolve. Life comes to earth through millions of frequencies, cosmic wave lengths with each one carrying very specific information.

In the end, each plant is an energetic system for listening or receiving that takes what it needs to express its specificity. It’s a bit the same system – but not at all the same thing of course – as these giga hertz, which are so harmful as they are close to cosmic frequencies, which in a quarter of a second bring the voice of a friend located 8,000 kms away to your ear. The wave has carried their voice practically instantaneously.

Life on earth is the result of an incredible system of information where each planet, each constellation, expresses itself through waves, each one carrying information.

The enormous door opened by Rudolf Steiner in medicine, in agriculture, in education etc. was to explain the energetic background of the physical world, or if you prefer, the “ins” and “outs” and results of these matrices of forces that allow the Earth to sustain what we call life, of which nature, in the broadest sense, is an illustration.

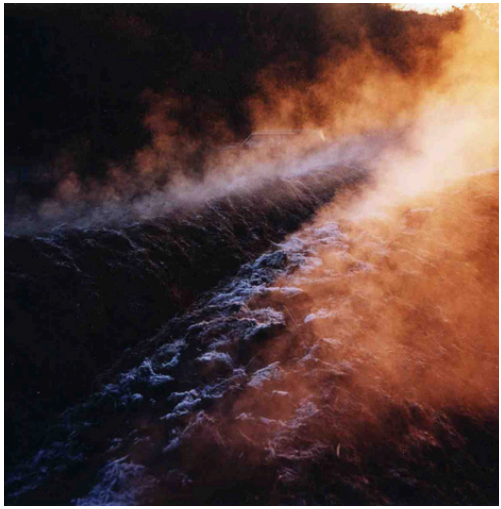
But also, to explain how we can call upon it and help ourselves to this system, which is free.

For this life is free; it is a gift given to the Earth. If we begin by explaining to students what this system is made of, how it functions, how we can measure its effects (crystallisations, morpho chromatography etc.), and how to call upon it as well, immediately their humanity, I mean their quality of being human, awakens.

We feel as though we are part of something immense from which we come from and that gives meaning to our life and the society to which we belong. And it is that also that could help us to avoid these great depressions – as many suicides as there are traffic deaths – that are so indicative of the failure of a system.

Finally, with a macrocosmic approach, we serve the Earth, and it gives back to us a hundred fold.

In this new approach we no longer impose anything on the plant with a blind eye to the rest, we only increase its receptive faculties, “its acoustics” if you like, to these forces that give it life.



We bring it closer to “its archetypal force” or the energetic matrix that shaped it and gave it body.

Genes on their own are a delusion; they are but the 1st visible element of an energetic plan that set it up. The scientific world knows this because it says, “it is not the gene itself but what is around it that acts”.

Genetics will only represent progress when we have understood the system that organises or arranges genes.

If this step is not taken, genetics becomes a terribly dangerous tool because it carries forces that are intensely disorganising that disturb and even attack the system that oversees making order of life on Earth.

And this can only result in more problems and necessitate “arbitrary assistants” that the world must pay for once again.

Real progress is understanding how a macrocosm, an energetic world, imprisons itself, separates from and isolates itself in matter; how each piece of the puzzle can help bring into being the link to a global image, an energetic whole, a macrocosm that becomes a microcosm.

We already have this in the myth of Isis and Osiris where Isis on Earth looks desperately for pieces of Osiris that Typhon (gravity) has separated into pieces (incarnation; separation). Finding again the link to all through an understanding of the parts is the work that scientists should undertake. And it is this that the biodynamic preparations do in their way. In the end, they act a bit like miniscule emitters/ receptors linked to very precise processes that can result after in specific visible traces and to microbiological life, etc. but which above all encourage harmony on a qualitative level. This can only be measured qualitatively and not quantitatively. What we like in a wine, or in a painting by Van Gogh, is something qualitative that is not earthly but celestial and it is for this reason that we take delight in the rest.

Art is the elevation of the material world. In agriculture it's the same thing. Wanting to study quality on the material level, through physical measurements ends quite simply in its negation. And it is in this dead end that we have shut up the scientific world. Scientists should serve life and not economic interests. Do you have 300 or 500 grams of love for your children?

This question seems absurd and yet it is what many scientists try to do without even being aware of it. Quality, the qualitative world cannot be grasped by this type of measurement. The plant raises the matter, gives it form and organises it. It is these organising or formative forces that should be measured to attain the qualitative world (sensitive crystallisation tests for example).

We are but at the first stages of these understandings, a bit like the airplanes a century ago that flew only a few metres above the ground. Things will go further and in a positive direction only if these approaches are done with conscience by understanding and respecting the living in that which is most noble. Even the thoughts of man or men form living forces, and that is also a green thumb, nothing other than an exchange of energies.

These forces are everywhere around us, but we must recognise and learn how to make use of them without deviation, without trying to copy them for reasons of economy or power, just to make friends with them. Proportions, geometric forms – sacred architecture for example – including numbers, are also carriers intheir arrangement of specific forces.

The golden number is an indivisible number then that always carries unity within itself, a link to globality. That is why it is used so often. It “speaks” to us through the proportions it imposes and nourishes us as well. The great painters often made use of it and now, marketing wants to take hold of it.

In a certain way, biodynamics creates a link with these same matrices of forces. Take the example of a vine: the miniscule buds that are barely visible in the month of March will become branches, leaves, flowers and then grapes. More than a ton of matter will thus appear in each ha in 6 months. We consider that 94% of this matter, from which we have extracted the water (it is then called dry matter) comes from photosynthesis or the vine’s ability to grasp solar, planetary, stellar energy and incarnate it.

It is there where one must act to correct the harmful effects of physical and energetic pollution, before or now when the energy becomes matter. After that “the game is over”; the matter is there and difficult to correct if it has a fault, a fault that we will undoubtedly refer to now or later as a sickness, which we won’t of course understand.

The great specificity of biodynamics is to act when energy becomes matter. It acts on the level of energy and thus indirectly on the physical level. It ishere where it differs entirely from organic agriculture. A few grams per ha of preparations could not have influence on the physical level, but on an energy level, it is quite a different story. It is here where biodynamics draws its power, especially nowadays when vital energies have never been so weakened. This is where its ability to make “better” wines comes from. And it is the inverse when one uses these terrible herbicides and systemics that poison the life of the soil and the sap.

Finally, the possibility of abstaining from using practically any oenological techniques in the cellar comes from the vine’s capacity or ability to link to these creative energies, or to this cosmic information. A grape that has been “well raised” can be exempt from any artifice in the cellar because it has in it all the information for behaving in the best possible manner, or for unifying all the characteristics of the year with the aestheticism from which it issues. Our agricultural interventions have affirmed in it a link to globality, to the creator harmony, to what Kepler called the music of the spheres. We then have a wine that is a place, an originality, a work of art and which will, de facto, be liked.

I hope that some among you, the young especially will understand these forces to which we can link the vine by our decisions, our gestures, and our understanding. It is essential for our societies to remain qualitative. We are here at the antipodes of what is being taught, I know, but everyone who has taken this approach with sincerity can confirm to you that the cellar should become again what it was formerly a maternity.

The work of the cellar has only needed to become intense to correct the grave secondary effects of synthetic chemical products that farmers were advised to use, without warning them of the consequences. It is these products that “spoil” the unity that an AOC should express.

This is why then one must no longer “make” a wine to “please” Mr. X or Mr. Y who, because of their name can “sell” to consumers who are too confident and badly informed of the changes of the past 25 years (how many people know for example that winemakers can make use of 350 aromatic and genetic yeasts along with a whole arsenal of other products as well?).

If man does not penetrate these generatrix spheres of life, solutions will not be sustainable.

They will remain debts for the whole world and will prevent us from eating and drinking the harmonious energies that by this single factare nutritive. Changing man’s conscience is contingent upon going through this understanding.

This is how to understand that agriculture can become an art again, the art of knowing how to comprehend and advisedly use the forces that give life to the Earth. This is above all the door that has been opened by biodynamics.

And it is for this reason that it has developed so broadly, especially in viticulture, because it touches a passionate clientele that is ever more sensitive to the truth of taste. The truth of taste - a key concept that the wine press is strangely silent about, mute even, and for what reason do you suppose?”

Nicolas JOLY, Coulée de Serrant

QUALITY CHARTER OF LA RENAISSANCE DES APPELLATIONS

Introduction

"The taste of wine can only reach its singularity and become inimitable when it has received the mark of its terroir and microclimate.

Everywhere on earth the four components – heat, light, water and soil/subsoil – combine differently in a unique way.

This is the subtlety of each appellation which plants, vines, olive trees, etc. understand in every instance in their own ways. The greatness of the appellations is based on this understanding, which also guarantees consumers a taste connected to the uniqueness of a specific place.

For vines to fully embrace their *terroir* with their roots, they must be alive and free of weed killers that destroy all micro-organisms. And to successfully capture their climate and its endless variations – wind, slope, humidity, etc. – the leaves must be free of synthetic chemical products that perturb photosynthesis.

When healthy farming – organic or biodynamic – allows the spirit of a place to express itself, cellar interventions and the arbitrary tastes they can create become unnecessary. The wine then keeps the taste of its origins and its ability to age, with complete transparency for the consumers."

Nicolas JOLY

We must respect a charter of quality

The rating system below necessarily includes all of the demands for organic agriculture and goes beyond them in order to allow an appellation to fully express itself. **Three levels** have been determined:

- **LEVEL 1** : Provides the necessary basics that must be implemented throughout the entire property for a minimum of 3 years.
- **LEVEL 2** : Is the logical continuation of this philosophy.
- **LEVEL 3** : Is the achievement of a long enduring process; it can however be challenged by climatic conditions.

This system incites the wine grower to work better. It also informs the customer about the effects each action in the vineyard and the cellar has on the expression of an appellation. Our goal is not to create a hierarchy among growers based on their work, but to bring those who share a common philosophy of wine closer together, whether they are wine producers, distributors or consumers.

Our goal is also to recover the full meaning of what an appellation is, in France and elsewhere, and thus set ourselves apart from the kind of competition that has been increased through technology and the lack of typicity it has brought. All the wine growers in the group must satisfy the first level of the charter at least. New members must be approved unanimously by the tasting committee members in attendance.

LEVEL 1
THE ABSOLUTE BASICS

Organic certification for the entire domaine (following a 3 year conversion period), plus a minimum of two years of biodynamics. (For more information, please refer to organic farming requirements).

The key points

- Cultivation of soils, or cover crops – weed killers strictly prohibited.
- Composting or natural fertilisers to foster microbial life in the soils.
- Prohibition of chemical fertilisers that perturb the life of the soils and the metabolism of vines.
- Exclusive use of natural products to fight diseases.
- Exclusion of all synthetic chemicals (surface, penetrating or systemic products – refer again to the technical specifications for organic agriculture for greater detail).
- Exclusion of genetically modified vine plants.
- Local wild yeasts from the vineyard must be used exclusively; all aromatic dehydrated yeasts or genetically modified yeasts must be banned. (Over 350 are allowed in Europe to generate 350 arbitrary flavours in wine.) Neutral re-yeasting is permitted for champagnes, champagne method and cremants to produce bubbles.
- No addition of wood chips is allowed.
- Reverse osmosis is banned along with any physical or chemical treatment that aims to reduce volatile acidity.
- Precipitation agents (eg. cmc - carboxymethyl cellulose) are banned.
- Agents used to correct lack of nitrogen (sulphates, phosphates, etc.) are banned.
- Anti-oxidation agents eg. potassium sorbate are banned. The use of sulphur is tolerated, in natural form preferably. Neither sulphur nor sterile filtrations are satisfactory. Sulphur is a natural product that cruciferous plants (radishes, mustard, etc) and most indigenous yeasts produce.
- Exclusion of 200% new wood.

LEVEL 2
GOING FURTHER

- Manual selection of future vines in order to respect and increase biodiversity. True massal selection, no clones for future plantings.
- Respect of natural fermentation processes by the exclusion of any nitrogen deficiency correction (sulphites, phosphates, etc.); fermentation activation agents (vitamins, thiamins, yeast shells, etc); the addition of enzymes, bacteria or any products resulting from synthetic chemistry; as well, of course, as any aromatic additives (which are authorised in some countries).
- Respect for the natural developmental conditions of the plant including meteorological influences. Prohibition of any form of irrigation for all European producers.
- Manual harvesting assuring greater respect for the grapes. No machine harvesting.
- The natural richness of the wine is respected: no chaptalisation or industrial concentration processes including no cryo-extraction (freezing the grapes).
- No addition of gum arabic.
- Biodynamic for a minimum of 3 years.

LEVEL 3
WHEN CONDITIONS ALLOW

- Manual harvesting in several passes.
- No sterile filtration or anything below 2 microns. No centrifugal filtering.
- No collage.
- Organic or biodynamic certification for at least 7 years (full restoration of the vineyard's ecosystem).
- Respect for the natural developmental conditions of the plant including meteorological influences. Prohibition of any form of irrigation for all new-world producers.

In the event of difficult climatic conditions, an exceptional dispensation maybe accorded in cellar practices.

INFORMATION ABOUT LA RENAISSANCE DES APPELLATIONS

Introduction

This group created in 2001 by Nicolas Joly has now 223 winegrowers from 17 different countries. Its purpose is to guaranty the full expression of the appellations and a wine with high quality level with a great orginality.

To obtain this, we act at 3 levels:

1

A legal guaranty of a good agriculture, this means an organic and/or biodynamic certificate on the whole vineyard and since at least 3 years. The presented wine comes from an alive soil, without chemicals. The consumer has the guaranty that the winegrower has taken a legal engagement. Over 90% of the group practices biodynamic agriculture.
Biodynamy is a mean more than a goal as such.

2

A guaranty that in the cellar actions nothing would change the full expression of the AOC's taste. When agriculture is right the cellar is a maternity and not a factory. Are banned of course all 300 aromatic yeast, osmoses, GMO, mechanical harvest (see quality charter).
The winegrower signs an engagement on his cellar actions for the last 3 years.

3

A tasting is made by a tasting comity made of well-known winegrowers.

The unanimity of the comity is needed to join the group. We want a wine with originality and thruth, a wine which "sings". In some cases and to help commercially winegrowers with good files, they can be part of one of the group's tasting even if their wines were refused by the tasting comity. Four to five tastings are organised every year in the world for the group with a great success, have a look at www.biodynamy.com for more information.

agriculture biodynamique

Domaine Marcel DEISS is located in Bergheim, a small village nestling in the heart of the wine region of Alsace. Managed today by Jean-Michel DEISS, the domaine consists of 38 hectares of vines spread over 11 communes and approximately 20 kilometers of hillside vineyards. The extreme variations in conditions of production at the domaine have led Mathieu Deiss to seek to express in each wine the three factors that make a wine complete: the grape variety, the vintage, the terroir (soil). The greater the wine, the more the gustatory linked to the soil take the place of the typicity linked to grape variety or vintage. When speaking of terroir, the following have to be taken into consideration: geology, pedology, climate and microclimate, technical exploitation of the character of the soil.

agriculture biodynamique

Historical estate since 1130 and in the familly since 1962, we have practiced biodynamic agriculture since more than 40 years. All pesticides, chemical fertiliser, weed-killers etc. which slow down the expression of the appellation have been excluded since 1980. All technologies including reyeasting, osmoses etc. are systematically excluded. The complexity of the wine, it originality and its aging potential are all linked to this choices as well as to the outstanding location of the vineyard.

Imported by Niche Vine

In the philosophy of Juchepie, the plant is the central figure. Its wellbeing is our first concern. Moreover, we are convinced that only a vine in good shape can give us the grapes, ideal to make a naturaly balanced wine. And it occurs that this is exactly the central idea of bio-dynamics. From 2007 onward, in addition to what we did already the previous years, we give our vines bio-dynamic preparations based on cow manure, silicium and different plants, often administered in homeopathic doses. Furthermore, we take into account, the moon calender, to make our treatments more effective still. All this following the principals of Rudolf Steiner, an Austrian philosopher, founder of the bio-dynamic movement. We are, as a matter of fact, convinced that these will help us to acquire a more thourough knowledge still of wine and winegrowing.

Imported by Allez Allez

Since the 17th century, the Vaillant family has handed down its land from generation to generation. Brothers and sisters, together with our team, we have been practicing biodynamic viticulture since 2008. To express the authenticity of our wines, we pay particular attention to work in the vineyard. In the cellar, we intervene very little in the wines, with no exogenous inputs and few transfers. All our wines are free of added sulfites, unfined and unfiltered, with the exception of wines with residual sugars (2 to 3 mg/L of SO2).

The Landron estate is a family-owned vineyard established after 1945. Jo Landron is one of the pioneers who believed in and supported the Muscadet appellation. Jo has always emphasized the unique characteristics of the terroirs in his cuvées. In 2021, Jo's eldest daughter, Hélène, joined the team along with her partner, Nicolas. New additions to the winery, such as diamond-shaped vats and amphorae, along with the introduction of animals like sheep and pigs in the vineyard, have brought a breath of fresh air to the estate.

BIODYVIN

Located in the south of the Loire, Domaine de la Garrelière covers 19 hectares of vines, on a hill just outside the 17th-century town of Richelieu. Working biodynamically for 30 years, the Plouzeau family is committed to producing living wines. Sauvignon, Chenin, Chardonnay, Gamay, Cabernet-Franc and Pinot Noir are the grape varieties planted on a clay-limestone base, with flinty clay and eolian sands making up the soil. La Garrelière wines are vinified with as few inputs as possible, to respect the terroir and authenticity of each *cuvée*.

Founded in 1961, our winery has been one of the pioneers of organic viticulture since the early 80s. We have been cultivating our vineyards according to biodynamic principles for over 15 years and have been a contract member of DEMETER since 2006. With great commitment to nature and species protection, we work today on almost 18 hectares of vineyards in Gönnheim, Bad Dürkheim and Wachenheim. Our focus is on the production of classic wines originating from Riesling and Pinot Noir as well as sparkling wines from traditional bottle fermentation.

Imported by Laudrup Vin

For generations we have lived from and for viticulture. With every further generation of Rebholz comes new perspectives, opportunities and possibilities. Nevertheless, the traditional principles of working continue as close to nature as possible and seeing wine as precisely this product of nature. Also the following generation, with the twins Hans and Valentin, is it important to follow the principles of the "type Rebholz" and to work with the concept of natural wine.

Our winery was one of the first organic wineries on the Kaiserstuhl and is a family winery with the focus on Chardonnay and Pinot Noir.
The basis for everything we do is biodynamic agriculture: we cultivate a living soil, deal with its peculiarities and support its valuable facilities where we can. Our style of cultivation is strongly influenced by our stays in French Burgundy. Family tradition "since 1649" means for us responsibility. For the fact that even in another 380 years healthy vines can still become great wines in a completely natural way.

Hand-harvesting, site-specific winemaking and a low-intervention approach in the cellar form the cornerstone of our thoughts and deeds. Since 1988, the family has worked according to the principles of organic viticulture. Today, as well as in the past, arable land, hedgerows, cattle and draft horses complete our idea of holistic farming. Diversity instead of monoculture. The vine as a smaller part of a larger whole.

Looking for an importer

In 1971, Jacques Granges acquired Domaine de Beudon, located on the right bank of the Rhône, between 740m and 900m altitude, to the east of Fully. This small plateau, clinging to the steep granite and gneiss slopes that form the base of the Grand Chavalard pyramid, dominates the Rhône plain. Its great diversity of soils and microclimates, its south-facing aspect and its dry climate favoring a multitude of plant and animal species, make it an exceptional terroir. From the outset, we have been committed to the gentle cultivation of this “celestial island”, accessible only by steep paths and a small private cable car. Certified BioSuisse since 1989 and Demeter since 1992.

Imported by Simply Grapes

Pian dell'Orino is situated 2 km southeast of Montalcino and has 11 ha of land, of which 6 ha are vineyards. They all are on the south-eastern slope of Montalcino, distributed among 4 different locations. Since 2004 we have classified our vineyards taking into consideration their different profiles. Every quality of wine is, by way of these profiles, tied to a certain vineyard or portion of a vineyard. Geological and lithological parameters, soil texture, inclination, water supply are only some of the parameters we took in consideration.
We always try to apply the scientific knowledge of chronobiology in our biodynamic acting and follow the rhythm of nature.
During the vegetation period we pass several times to cut bunches with the aim to keep only the best grapes for vinification. During harvest, the berries undergo a strict selection first by hand and then passing an optical sorting machine. Only healthy and ripe berries end in the vinification vat. Neither artificial yeast or bacteria nor any other technological additives are used during the whole process of transformation in order to maintain the authentic and characteristic taste of our vineyards and of the vintage.
Then the wines are aged in big Slavonian and French oak barrels ranging from 10 to 50 hl.
The total production varies each year depending on the vintage between 12.000 and 18.000 bottles.
The winery is certified by ICEA for the organic agriculture and by AgriBio for the biodynamic agriculture.
